

Highly Cited Articles. 29.  
Articles from Scandinavian Journals.

Number 42

October 18, 1976

Here is a list of the fifty most cited articles from Scandinavian journals. The list presents a number of surprises. The first is the number of citations received by the articles. In most of our 'regional' lists of highly cited articles, the least cited on the list has rarely been cited more than 200 times. The last article on this list (number 50 by Kofod-Johnsen and Ussing) received almost 300 citations.

As with our previous lists, only a few journals are involved--in this case only ten. The journals are listed in Figure 1. Two of them published two-thirds of the articles: *Acta Crystallographica* 21, and *Acta Physiologica Scandinavica* 12. Half of the journals are medical; the other half are about evenly divided between chemistry and physics.

Only twenty-three of the articles report work done in Scandinavia. The rest come from around the world, most of them (16) from the United States. In our previous studies of regional journals and their highly cited articles, there have always been a number from scientists outside the region, but not to this extent. The list confirms the international character of Scandinavian journals demonstrated in a previous journal citation analysis.<sup>1</sup>

Exactly half the articles report medical

research, a higher proportion than usually found in lists of this type. Nineteen of the articles deal with physics, most of them from *Acta Crystallographica*.

The two oldest articles (numbers 22 and 47) were published in 1948. They describe methods for biochemical analysis that have been widely used or adapted for wide use. The two are Ouchterlony's "*In vitro* method for testing the toxin production capacity of diphtheria bacteria," and Blix's "Determination of hexoseamines according to Elson and Morgan." In all there are four articles from the 1940s, twenty from the 50s, twenty-five from the 60s and one from 1971. This last is a paper by Germain *et al.* (number 35) on "The application of phase relationships to complex structures. It is the third of a series ("3. The optimum use of phase relationships.") The first two articles in the series weren't cited often enough in the period 1961-1975 to make this list of fifty articles. However, all the three parts have been cited a total of 732 times. The same situation probably holds for other articles on the list that are parts of series (numbers 10, 16, 27, and 45).

The articles are listed in Figure 2 in decreasing order of their total citations.
