

Highly Cited Articles. 39. Biochemistry Papers Published in the 1950s.

We recently published a list of the 1950s citation classics in the physical and chemical sciences.<sup>1</sup> Here is the list of biochemical articles. The biological, medical, and behavioral classics will follow shortly.

Each article was cited at least 500 times in the 15 year period from 1961 to 1975. Taking the entire universe of published articles into account, only about one in 20,000-or 0.005%-- receives so many citations.

In February we published a list of highly cited biochemical articles published in the 1940s.<sup>2</sup> That list of 89 items, like the 1930s life sciences list, 3 which was composed primarily of biochemical articles, reflected one of the basic concerns of biochemistry--the analysis of phosphorus and its physiologic compounds. Some of the 78 highly-cited biochemical articles of the 1950s, listed in Figure 1, continue to reflect the importance of research determination. phosphorus into Phosphorus is basic to the study of DNA, sugars, lipids, and other biochemical substances.

Of the 78 articles in Figure 1, 25 have received over 1,000 citations, and 13 over 2,000. The majority of these papers concern methodology. This should come as no surprise to

biochemists themselves, many of whom acknowledge that methods are the backbone of all scientific research. David Gillespie of the National Cancer Institute discussed the process by which a method paper becomes a "classic."<sup>4</sup> He commented that "the distinction between a classic and a quickly outmoded method lies in the ability of the investigators to see the uses to which the method will but and evaluate be Darticular parameters accordingly and, as importantly, to take heed of the little irregularities that lead to significant improvements."

The importance of methods papers is also emphasized by Karl Piez, Chief of the Laboratory of Biochemistry of the National Institute of Dental Research. His highly-cited 1960 paper<sup>5</sup> modified the methodological procedure of the 1950s paper of Spackman, Stein, and Moore (66). Piez commented that their method was "a highly developed method and one of the most important procedures in modern biochemistry .... ''6 Still, Piez was compelled, for the purposes of his own biochemical investigations, to modify the procedure. This illustrates the nature of biochemical advances. Both papers have now achieved very Figure 1. Highly cited articles in biochemistry published in the 1950s. A = item number. B = total citations 1961-1975. C = average yearly citations 1961-1975. D = citations in 1974. E = citations in 1975. Articles are listed alphabetically by first author.

high citation rates.

On the other hand, the article by Watson and Crick (74) may be indicative of what is called the "obliteration phenomenon."7 Many important scientific discoveries are quickly incorporated into the common wisdom of the field. Authors no longer feel compelled to cite the original discovery. Compared to the citation rates for other classics on the list and considering the enormous amount of research in molecular biology, the Watson and Crick paper will probably soon become obliterated. In the period 1961-1975, it received only 552 citations -- a yearly average of 37. In 1975 it was cited "only" 16 times. Few other papers in Figure 1 have registered such sharp decreases.

Many of the papers on this list are citation superstars--Lowry (39) with 50,016 citations; Folch (23) with 7,454; Burton (9) with 5,037; and Bartlett (1) with 2,791. All of these have 1974 and 1975 citation rates well above their yearly averages, indicating that activity in these fields has increased in recent years.

Six authors of these 1950s articles also appeared on our 1940s list with method papers: Lowry (39), Markham and Smith (41), Moore and Stein (47, 48, and 66), and Taussky (69). Those by Markham and Smith, and Moore and Stein, concerned chromatographic techniques.

Eleven of these articles have been authored by 11 Nobel laureates. Watson of the U.S. and Crick of England (74) shared the Nobel Prize for medicine in 1962. Tiselius of Sweden (70) received the 1948 Prize in chemistry for his discovery and isolation of mouse paralysis virus. In 1972 Porter of Britain (55) received the medical Prize for research on the chemical structure and nature of antibodies. The 1970 Nobel Prize for chemistry was awarded to Leloir of Argentina (56) for his discovery of sugar nucleotides and their role in the biosynthesis of carbohydrates. For his research into the inner workings of living cells, deDuve of the U.S. (24) received the 1974 Nobel Prize for medicine. The 1975 Prize for chemistry was awarded to Prelog of Switzerland (11), a native of Yugoslavia, for his research on the structure of bio-

logical molecules. In 1955 duVigneaud of the U.S. (6) received the chemistry Prize for his work on pituitary hormones. Three other Americans, Anfinsen (33), Moore and Stein (47, 48, and 66) shared the 1972 chemistry Prize for their pioneering studies on enzymes.

Figure 2 lists the 22 journals that published these articles. Just two journals published 32 of the 78 articles. The Journal of Biological Chemistry published 18 articles, and the Biochemical Journal 14. Analytical Chemistry and the Journal of the American Chemical Society published 6 each. All but 3 of the articles authored by Nobelists appeared in these four journals, which accounted for 56% (44 articles) of the papers in Figure 1.

The great majority of these 78 articles were published in the latter half of the 1950s. From 1950-1954, 23 articles were published. The remaining 55 articles appeared from 19551959, with increasing frequency by the years. In the late 1940s and early 1950s there was a tremendous amount of research done on the structural elements of DNA. Both Watson<sup>8</sup> and Crick<sup>9</sup> have acknowledged that at the time of their own efforts numerous other investigators were active. The success and impact of their work helps explain the flurry of activity in biochemistry in the mid to late 1950s-with a little monetary help from our friends in Washington and elsewhere.

Much of the methodological groundwork for the 1950s biochemical research--such as chromatography and its application to nucleic acids--had been laid in previous decades. In the same way, these classic papers of the 1950s helped lay the foundation for biochemical research today. In particular, the discovery of DNA and its capacity for carrying genetic material has led science to a more complete understanding of the mysteries of life.
